Developing Information Technology Policies for Enterprise Resource Planning to Improve Customer Orientation and Service Riyanarto Sarno and Anisah Herdiyanti,

Faculty of Information Technology, Institut Teknologi Sepuluh Nopember, Surabaya, 60111 Indonesia

Summary

Sustainability is critical challenge faced by enterprises nowadays. The objective of enterprises is to ensure that the short and longterm plans are engaged with the sustainability dimensions of technology, social, environmental and economics. Since Information Technology (IT) can be considered as a catalyst to the sustainability of enterprises, in this paper we concern with IT-related enterprise objectives or business goals; i.e. improve customer orientation and service, which is Business Goal number 4 (BG4) within Control Objectives for Information and Related Technology (COBIT). Furthermore, the Enterprise Resource Planning (ERP) system is considered as an important IT application and is commonly implemented in an enterprise; however, in many cases the ERP practices were not successful and their failure factors were not published. In this regard, we propose ten IT policies for ERP practices, which are developed based on ten IT Processes within two IT Goals (ITG), i.e. ensure satisfaction of end users with service offerings and service levels (ITG3) and make sure that IT services are available as required (ITG23). These IT Goals are aligned with BG4.

The IT policy objectives are designed to support ITG3 and ITG23 in achieving BG4. Then, ten IT Policies for ERP practices are developed based on the IT policy objectives for the related IT Processes. In this paper, we elaborate more detail the IT policy for ERP practices related to IT Process Delivery and Support 7 (DS7); i.e. *educate and train users*. The IT policy for ERP practices related to DS7 is also equipped with the management directions. Then, the procedures are developed based on the IT policy objectives and management directions; whereas the contents of the procedures are composed according to the existing Enterprise Maturity Level (EML) of the corresponding IT Process. The IT policy for DS7 is provided with three procedures and the related activities.

Hence, the IT policies for ERP practices, which were supported by the procedures, could suitably facilitate the success of an ERP system during planning, implementation and delivery of services in the enterprise. Furthermore, the IT policies for ERP practices ensured the ERP could improve customer orientation and service.

Key words:

ERP, Policy, Procedure, COBIT, Service Portfolio

1. Introduction

The globalization of customers, products and services are driving the enterprise to focus on the sustainability, which encompasses the technology, social, environmental and economics dimensions. The Information Technology (IT) is poised to play critical role to the sustainability of the enterprises [1]. The role of IT can be considered as a catalyst for the sustainability of short-term and long-term of enterprise objectives, which is known as business goals.

Moreover, the Enterprise Resource Planning (ERP) system is an important IT application, which is conceived to contribute in the success of managing business process in enterprises. Many enterprises have been running the ERP system successfully worldwide [2]. The ERP system enables an enterprise to run the business processes in the high levels of delivering service to customer, balancing demand and supply, and integrating ERP functionalities, i.e. human resources management, sales, marketing, manufacturing, operations, purchasing, and finance [3]-[4].

Even though the ERP system is widely used in many enterprises, but the success of ERP practices are rarely issued. The ERP practices involve a lengthy and complex process [5]; these will give more opportunities that many problems will affect the ERP practices. However, the problems associated with the software implementations are not new, nor specific to ERP system [6].

Many studies have reported several reasons of ERP failure reasons. The failure reasons of ERP practices can be vary from the high level management who had the objective of integrating ERP within business, to the end users who operate the ERP system; for instance, Davenport [7] reports the failure of enterprise in resolving the business needs and the new IT system, as the reason of ERP practice failures. Recent researches by Kumar *et.al* [8] and Markus *et.al* [9] stated that one of the major problems of ERP failures is the lack commitment, acceptance and readiness of the enterprise to deploy the system. Hence, the delivery and support of ERP practice

Manuscript received May 5, 2010 Manuscript revised May 20, 2010

failures are considered to be the major problems, including: the lack of high level management commitment, the lack of knowledge regarding ERP system [10], the mismatch between the delivered applications and the enterprise's expectations and the lack understanding of ERP system operations.

Meanwhile, the other studies [11]-[13] consider the planning and organization, and the acquirement and implementation of the ERP practice failures, including the unclear business objective and the lack of expertise to support the enterprise, respectively. Since the ERP practice failures can be seen from different domains of Control Objectives for Information and Related Technology (COBIT) framework, in this paper we concern with evaluating the ERP readiness based on the IT processes from planning and organizing, acquiring and implementing, and delivering and supporting. Thereby, the Enterprise Maturity Level (EML) is measured to evaluate the ERP readiness in the enterprise.

Furthermore, a successful of ERP practice requires control during planning, implementation and delivery of services, particularly related to IT. Thus, the IT controls can overcome the problems of ERP failures, and regulate the life cycle of service and related decision rights. The IT controls should be supported with the business controls [14]; hence, we concern with IT policies for ERP practices within COBIT framework to achieve the Business Goals 4 (BG4), i.e. *improve customer orientation and service*. We applied COBIT due to the completeness [15] and internationally applicable IT Governance framework in many different industries [16].

Ten IT policies for ERP practices are developed in order to achieve BG4; they are based on ten IT Processes within two IT Goals (ITG), i.e. *ensure satisfaction of end users with service offerings and service levels* (ITG3) and *make sure that IT services are available as required* (ITG23). Then, the IT policy objectives are designed for the related IT Processes by considering the contents and structures of ERP system, which are based on the service portfolio referring to Sarno and Herdiyanti [17]. The IT policy objectives accommodate controls, direction and authority for the corresponding ERP system functions and the Responsible Job Functions (JF).

In this paper, we elaborate the IT policy for ERP practices which relates to IT Process Delivery and Support 7 (DS7); i.e. *educate and train users*. The IT policy for ERP practices related to DS7 is developed by considering the IT policy objectives. The management directions are also designed, and accordingly the procedures are developed. The contents of the procedures consider the EML measurement results, which are structured to improve the enterprise readiness.

2. Theoretical Consideration

2.1 COBIT

Control Objectives for Information and Related Technology (COBIT) framework provides a reference process model and common language for IT Process within enterprises. It defines 17 IT-related Business Goals (BG), 28 IT Goals and 34 IT Processes, which are groupped into four domains; they are the Plan and Organise (PO), the Acquire and Implement (AI), the Deliver and Support (DS), and the Monitor and Evaluate (ME). Each of the IT Process consists of control objectives, maturity model and general measurement for monitoring the IT Process performance [18]-[19].

The PO domain covers strategy and concerns with the identification of IT contribution to the achievement of business goals; whereas the AI domain is about developing and acquiring IT solutions. The DS domain concerns with the actual delivery of IT to achieve the business goals while the ME domain addresses performance management, including the regulatory compliance [14].

The roles and responsibilities for each IT Process are also provided to the effectiveness of IT Governance by the representation of Responsible, Accountable, Consulted and Informed (RACI) chart. The RACI chart defines what activities should be delegated and to whom. Responsible is attributed for the people who do the work to achieve the task which is approved and directed by the Accountable person. This Accountable person is the only person who is ultimately accountable for correct and thorough completion of the task. The Consulted and the Informed roles are whose opinions are sought and whose are kept up-to-date on the task progress, respectively [14],[20].

Furthermore, each of the IT Process has control objectives to successfully implement in the enterprise. Control means the policies which is equipped with procedures, practices and organizational structures. A control is needed to assure that business objectives will be achieved and undesired events will be prevented or detected and corrected [14]. The control objectives of IT Processes provide a complete set of high-level requirements for management consideration over the IT Processes considering the value and the risk of the implementation. Hence, the enterprise needs to select the control objectives that are applicable, and then decide those that will be implemented. Furthermore, the enterprise should make its own best practice which consists of the act to implement the control objectives and also consider the risk of not implementing the control

objectives. In summary, the control objectives are statements of desired results or goals which an enterprise would like to be achieved with the implementation of control procedures over related IT Processes [18],[21].

2.2 The Enterprise Maturity Level (EML) in COBIT

The EML model in COBIT is a method for evaluating the maturity of IT Processes in an enterprise, and is classified into six levels of maturity from *non-existent* (level 0) to *optimized* (level 5). This model is derived from the maturity model of the Software Engineering Institute (SEI) which is defined for the maturity of software development capability. The definition is similar to Capability Maturity Model (CMM) but is interpreted for the nature of the management of IT Processes in COBIT. Moreover, the purpose of EML model is not to assess the adherence level of the control objectives, but to identify where issues are and how to set priorities for improvements.

Within non-existent (level 0), the management processes are not applied at all. In the *initial/ad-hoc* (level 1), there is no standardized process. Within repeatable but intuitive (level 2) there is no formal communication of standard procedures. It may exist informal understanding of policies and procedures. Further in the defined process (level 3) the management processes are standardized, documented and communicated. It exists on the definition and documentation of policies and procedures for all key activities. Whereas in managed and measurable (level 4), the compliance monitoring and measurement of the implemented policies and procedures for developing and maintaining all processes are taken. Furthermore in the optimized (level 5), processes, policies and procedures are standardized and integrated in the continuous improvement management [14],[21].

2.3 Failures of Enterprise Resource Planning (ERP)

ERP system is an integrated software solution, which is typically offered by a vendor as a package. The package offers seamless integration of all the information that flows through the enterprise. The information also reflect the business process in the enterprise, such as financial, accounting, human resources, supply chain, and customer information [22]-[23].

Wallace and Kremzar [3] described ERP system as an enterprise-wide set of management directions that balances demand and supply, integrates the customers and suppliers into a complete supply chain, employs proven business processes for decision-making, and provides high degrees of cross-functional integration among business processes, i.e. inventory/logistics, manufacturing, sales, finance, manufacturing, marketing, customer support, and human resources. Thereby, an ERP system enables an enterprise to run its business with high level of productivity and customer service, and simultaneously lower costs and inventories [24]. As ERP system plays an important role in business, the related problems and critical factors of the implementation have been investigated in the previous studies [25]-[28].

Nevertheless, there have been many reports of unsuccessful ERP implementations within business, including the inability of Hershey to ship candy at Halloween, Nike losing shoe orders, and FoxMeyer's failure to process orders [29]. Majed *et.al* [26] reported that 70% of ERP implementations did not achieve the estimated benefits. In other studies, the failures of ERP implementations range from 40% to 60% or higher [30]. Further, the failures of ERP system implementation projects have been known to lead to problems as serious as organizational bankruptcy [23], [31]-[32].

Hence, many studies have been investigated to determine the critical failures factor for implementing ERP [22]. Some of the failures factors are the failure of adapting ERP system; the lack quality of reengineering business process and testing; the over confidence on massive customization; the lack of support from top management, including unrealistic expectation of ERP system; the high replacement of project team members; the lack of effectiveness on consultancy and in managing project; very tight project schedule; insufficient IT infrastructure; the ambiguous concept and use of ERP system from the user's view due to the lack education and training, which may lead to resistance to change [29].

2.4 ERP Functionalities within the Service Portfolio

The term of a service represents specific business function while a system contains of organized services to accomplish a specific objective [31]. A service can provide a single discrete function or a set of related business functions. A service that perform a single function is said to be fine grained, for example : calculating total sales; the services which perform a related set of business functions are called to be coarse grained, for instance : analyzing sales history [34]. The services can communicate with each other to share business functions in a widespread and flexible way.

A service portfolio provides three levels of views, which are the conceptual view, the logical view, and the physical view [17]. The conceptual view supports the conceptualization of services and governance needs, and it covers application architectures; while the logical view provides the architecture components for the services conceptualized, hence it covers information architectures; whereas the physical view identifies the physical implementation components of the services, and therefore it covers data and technology architecture. Furthermore, based on Sarno and Herdiyanti [17] we categorize twelve of Functional Domains (FD) in the service portfolio of an ERP system, which are Inventory (FD1), Manufacturing (FD2), Account Payable (FD3), Account Receivable (FD4), Fixed Assets (FD5), Cash and Bank Management (FD6), General Ledger (FD7), Reporting (FD8), Sales Force Automation (FD9), Marketing Automation (FD10), Customer Support (FD11), and Human Resource Management (FD12).

3. Methodology Consideration

This study concerns with Business Goal 4 (BG4) in COBIT framework, i.e. *improve customer orientation and service*. There are two IT Goals (ITGs) and ten related IT Processes to achieve BG4. The related IT Processes are grouped into the ITGs. They are *manage quality* (PO8), *enable operation and use* (AI4), *define and manage service levels* (DS1), *manage third-party services* (DS2), *educate and train users* (DS7), *manage service desk and incidents* (DS8), *manage problems* (DS10), and *manage operations* (DS13) to achieve *ensure satisfaction of end users with service offerings and service levels* (ITG3); whereas *manage performance and capacity* (DS3), *ensure continuous service* (DS4), DS8 and DS13 to achieve *make sure that IT services are available as required* (ITG23).

Then, the content of Enterprise Maturity Level (EML) measurement is composed according to the Maturity Model in the COBIT for the corresponding IT Process. The EML value is calculated according to the current condition in the enterprise. Furthermore, the IT Processes are correlated with the Functional Domain (FD) within the ERP system. Hence, the EML value represents the ERP practices in the enterprise.

Meanwhile, the development of IT policies for ERP practices is based on the related IT Processes. Hence, there are ten IT policies for ERP practices, which aim to achieve BG4. Furthermore, the structure of IT policies for ERP practices adopts the structure of IT process description in COBIT in order to have the reader familiar with the IT policies. The IT policies for ERP practices are developed by considering the IT policy objectives; then, the related procedures are derived accordingly. Further, the contents of the procedures also consider the EML measurement results in order to help the enterprise improving the ERP practices. Thereby, the suitable procedures are appropriate for the readiness of the enterprise to plan, implement and deliver the ERP services.

4. The Proposed IT Policies for ERP Practices

This section proposes ten IT policies for ERP practices and the corresponding procedures, as well as the management directions. In order to describe the methodology we take the Information Technology (IT) Process, i.e. *educate and train users* (DS7) as the example.

The Enterprise Maturity Level (EML) measurement from level 0 to level 5 for DS7 are elaborated; the examples of EML measurement for level 2 and level 3 can be seen in Table 1 a) and 1 b) respectively. Table 1 c) describes that the IT Process maturity level is 2.45, which is calculated based on the EML values from level 0 to 5.

We present Table 2 to elaborate the IT policy objectives, which are designed effectively and efficiently according to the Control Objectives for Information and Related Technology (COBIT) processes. The IT policy objectives for ERP system in Table 2 are structured based on the control objectives of IT Processes which relate to the achievement of BG4. The IT policy objectives accommodate the authority, the direction and the controls for the corresponding Functional Domain (FD) in the ERP system. Since the IT policies for ERP practices control the FD in the ERP system, we also describe the relation between the FD and the IT Processes. Firstly, we chose the Responsible Job Functions (JF) based on the Responsible functions for each IT Processes in COBIT. Secondly, the related FDs are considered by the Responsible JF to support the successful achievement of IT policy objectives for the related IT Process.

Furthermore, each IT process has the IT policies for ERP practices which are developed by considering the IT policy objectives. Hence, we present Figure 1 to elaborate the IT policies for ERP practices; they are ordered by sequences number from one to ten. It consists of the title, the control over IT Process in COBIT, the relation with the FD in ERP system based on Table 2, the alignment with business requirements, and the general actions to perform the IT policies.

Moreover, since we consider the IT Process DS7, Figure 2 is equipped to present the management directions, which include the inputs for DS7 and the corresponding outputs of policy implementation, and also the Job Functions (JF) and activities which represents Responsible, Accountable, Consulted and Informed (RACI) chart. Hence, the IT policies for ERP practices ensure that the ERP system is aligned with the business requirements. Thereby, the success of ERP system implementation can be achieved accordingly because the IT policies for ERP practices as IT controls supported the business controls in order to design the integrated application controls in the enterprise.

Table 2: The IT Processes, the IT policy objectives for ERP practices, the r	responsible JF and the related FD

1. Policy for IT Process of Managing ERP System Quality

Control over COBIT IT Process of

Managing Quality (PO8)

related to ERP Functional Domain (FD) of

Reporting (FD 8) and Customer Support (FD11)

addressing the business needs for ERP system of

ensuring the continuous improvement of the quality of ERP system to optimize service delivered and maximize the benefits of implementing ERP system in the enterprise

is accomplished by

defining the Quality Management System (QMS) related to ERP system, managing the ERP standard and quality practices, and continuous improvement of QMS related to ERP system and the ERP standard and quality practices

2. Policy for IT Process of Enabling ERP Operation and Use

Control over COBIT IT Process of

Enable Operation and Use (AI4)

related to ERP Functional Domain (FD) of

Reporting (FD8) and Customer Support (FD11)

addressing the business needs for ERP system of

assuring the satisfaction of RACI and end users regarding with the service offerings and service levels of ERP system to seamlessly integrate the solutions of ERP system into business

is accomplished by

developing the knowledge transfer mechanism of ERP system based on RACI, and providing the training materials for the knowledge transfer

3. Policy for IT Process of Defining and Managing ERP Service Levels

Control over COBIT IT Process of

Enable Operation and Use (AI4)

related to ERP Functional Domain (FD) of

Inventory (FD1), Manufacturing (FD2), Marketing Automation (FD10), and Customer Support (FD11)

addressing the business needs for ERP system of

ensuring the alignment of IT -related business goals align and the IT goals regarding with ERP system

is accomplished by

defining the agreements regarding with service and operational level of ERP system, and monitoring, review, updating and communicating the achievement of service and operational level

4. Policy for IT Process of Managing Third-party Services within ERP System

Control over COBIT IT Process of

Manage Third-party Services (DS2)

related to ERP Functional Domain (FD) of

Inventory (FD1), Manufacturing (FD2), Account Payable (FD3), Reporting (FD8), and Marketing Automation (FD10)

Fig. 1 The IT policies for ERP practices to improve customer orientation and service

4. Policy for IT Process of Managing Third-party Services within ERP System (continued)

addressing the business needs for ERP system of

ensuring the satisfaction of third-party services for RACI and end users, while providing adherence of the benefits, costs and risks regarding with the agreements

is accomplished by

identifying the third-party services within ERP system, structuring formally the service relationship, and managing the third-party performance, including risk mitigation

5. Policy for IT Process of Managing ERP Performance and Capacity

Control over COBIT IT Process of

Manage Performance and Capacity (DS3)

related to ERP Functional Domain (FD) of

Inventory (FD1), Manufacturing (FD2), Account Payable (FD3), Reporting (FD8), and Sales Force Automation (FD9)

addressing the business needs for ERP system of

providing optimal performance and capacity of ERP infrastructure, and resources and capability regarding with ERP system to assure that the information resources from ERP system supporting business requirements are available continuously

is accomplished by

establishing the plan, the monitoring, the report, and the forecast of ERP system capacity, availability and performance

6. Policy for IT Process of Ensuring ERP continuous service

Control over COBIT IT Process of

Ensure Continuous Service (DS4)

related to ERP Functional Domain (FD) of

Inventory (FD1), Manufacturing (FD2), Reporting (FD8), and Customer Support (FD11)

addressing the business needs for ERP system of

providing the automated solution of the ERP service resilience to assure the minimum of business impact in the event of ERP service disruption

is accomplished by

establishing and maintaining the ERP contingency plans, including the training and the testing, and the back-up, the recovery and resumption plans.

7. Policy for IT Process of Educating and training users related to ERP system

Control over COBIT IT Process of

Educate and Train Users (DS7)

related to ERP Functional Domain (FD) of

Reporting (FD8) and Human Resource Management (FD12)

Fig. 1 The IT policies for ERP practices to improve customer orientation and service (cont.)

7. Policy for IT Process of Educating and training users related to ERP system (continued) addressing the business needs for ERP system of providing user training of the ERP system based on RACI, and monitoring and measuring the result of the training to increase the effective use of ERP system implementation in the enterprise is accomplished by managing the curriculum and the delivery of training, and evaluating the training performance. 8. Policy for IT Process of Managing ERP service desk and ERP incidents Control over COBIT IT Process of Manage Service Desk and Incidents (DS8) related to ERP Functional Domain (FD) of Inventory (FD1), Manufacturing (FD2), Reporting (FD8), and Customer Support (FD11) addressing the business needs for ERP system of providing a well-designed and well-performed ERP service desk and ERP incidents to increase productivity through the response of the queries in a prompt delay and to address the root cause quickly is accomplished by establishing and managing the criteria of ERP incidents and procedures of ERP service desk, and monitoring and reporting the performance of ERP service desk 9. Policy for IT Process of Managing ERP system problem Control over COBIT IT Process of Manage Problem (DS10) related to ERP Functional Domain (FD) of Inventory (FD1), Manufacturing (FD2), Reporting (FD8), and Customer Support (FD11) addressing the business needs for ERP system of providing minimal defects and rework of service solution and delivery to maximize the availability of system, improve service offerings and service levels, which can ensure the satisfaction and convenience of ERP users according to RACI is accomplished by managing the integration of problem management system, including identify the ERP system problem, define the solutions and resolve the ERP system problem, record and analyze the trends of ERP system problem 10. Policy for IT Process of Managing ERP Operation Control over COBIT IT Process of Manage Operation (DS13) related to All of ERP Functional Domain (FD) addressing the business needs for ERP system of providing operating policies and procedures of effective data management and ERP infrastructure maintenance to maintain data integrity, help reduce business delays and minimize the ERP operating costs is accomplished by defining the policies and procedures for operating ERP system, particularly regarding with data processing and sensitive assets. and maintaining the ERP infrastructure

Fig. 2 The management direction for IT policies related to the educate and train users (DS7)

Furthermore, we categorize the EML measurement result less than 2.5 out of 5 as the foundation level; whereas the result between 2.5 and less than 3.5 as the intermediate level and the result starting from 3.5 up to 5 as the advance level. These categorizations determine the contents of the procedures in the IT policies for ERP practices. Hence, the contents of the procedures for DS7 should aim to improve the foundation level into the higher level, i.e. the intermediate level and up to the advance level, since the EML measurement result for DS7 is 2.5. The contents of the procedures for DS7 consider the improvement of the documentation and effective communication, and further to ensure that best practices followed by monitoring and measuring the are performance. Based on the IT policy objectives in Table 4, the IT policies for ERP practices for DS7 consist of three procedures. Figure 3 shows the detail description of IT policy objectives related to DS7. Then Figure 4-6 describes the procedures of IT policies for ERP system related to DS7; those are 1) identification of education and training of ERP system according to the service portfolio, 2) delivery of education and training of ERP system according to RACI, and 3) evaluation of education and training of ERP system according to RACI.

- Identification of education and training of ERP system according to the service portfolio
 - The contents of training curriculum considering: the business needs and strategy, the information and enterprise values, the user skills, and the delivery methods, the target size and timings, and the service portfolio of ERP system, which includes: data/information, application and technology architecture.
 - The establishment and the regular update of the curriculum
- Delivery of education and training of ERP system according to RACI
 - The preparation : the delivery mechanism, and the training schedule and appointments
 - The people : the target group based on RACI, the teachers, trainings and the mentors
 - The documentation : the training records, including registration, attendance
- Evaluation of education and training of ERP system according to RACI
 - The evaluation of training content, quality and cost for future curriculum
 - The evaluation of individual performance regarding with training activities

Fig. 3 The detail description of IT policy objectives related to DS7

- > Define the training curriculum
 - 1)Human Resource Manager (HRM) coordinates with Training Department (TD) to propose meeting for defining the training curriculum of ERP system.
 - 2)HRM proposes the training curriculum meeting to the Chief Information Officer (CIO).
 - 3)CIO reviews the proposal, consults with the Business Executive (BE) and then validates the training curriculum meeting considering the feasibility of the program and the enterprise's budget.
 - 4) TD selects the meeting schedule, which is agreed by the HRM, then structures the draft of training curriculum and invites the meeting participants; they are Head of Information Technology Operations (ITO), Head of IT Administrations (ITA), Head of IT Development (ITD), Project Management Officer (PMO), and Compliance, Audit, Risk and Security (CARS).
 - 5)The training curriculum meeting is held based on the schedule. The meeting discusses the draft of training curriculum and results the agreement of training curriculum, considering: the business needs and strategy, the information and enterprise values, the user skills, and the delivery methods, the target size and timings, and the service portfolio of ERP system.
 - 6)The meeting report is documented by the TD, signed by the HRM, and inventoried by the ITA.
- ► Legalize the training curriculum
 - 1)The HRM sends the agreed training curriculum to the CIO for approval.
 - 2)The CIO consults with the BE to approve the training curriculum, considering the budget, the enterprise's IT action plan and the availability of resources.
 - 3)The CIO approves the training curriculum and sends to the ITA for the formal pronouncement. Otherwise, the CIO asks the HRM to revise the contents of the agreed training curriculum before approval.

- 1)The TD builds the training program considering the target group, which is consulted with the BE, The ITO; the efficient delivery mechanism, which is consulted with the ITD and the PMO; and the training schedule, which is consulted with the ITA, and the CARS. Furthermore, the target group is chosen based on the knowledge gaps and target requirements regarding with the service portfolio of ERP system, which includes application, data/information and technology architecture.
- 2)The training teachers, trainers and mentors are appointed by the Human Resource Manager (HRM) and coordinated with the TD for managing training sessions within the training schedule.
- 3) The HRM signed the training program and asked the TD to send the training program to the curriculum Chief Information Officer (CIO) for approval.
- > Approve the training program
 - 1)The CIO consults with the BE to approve the training program, considering the feasibility program and the availability of resources.
 - 2) The CIO approves the training program and sends to the TD for implementation. Otherwise, the CIO asks the TD to revise the contents of the training program before approval.
 - 3) The TD informs the Marketing Manager (MM), Finance Manager (FM), Warehouse Manager (WM), and Production Manager (PM) regarding with the scheduled of the training program.
- \geq Deliver the training
 - 1)The TD invites the training participants according to the target group in the training programs, and inform the BE and CARS about the training sessions.
 - 2) The TD delivers the training curriculum based on the training schedule in the training program.
- ➤ Document the training
 - 1)The TD documents the training, including the registration and the attendance, which are consulted with the training participants; and the training records.
 - 2)The TD asks the CIO to sign the training documentation for approval and sends the training documents to the ITA.

Fig. 4 Procedure identification of education and training of ERP system

Fig. 5 Procedure delivery of education and training of ERP system

> Build the training program

► Evaluate the training performance

- 1)Training Department (TD) evaluates the training content delivery upon completion for relevance and quality, which are consulted with the Head of IT Administrations (ITA) and the Compliance, Audit, Risk and Security (CARS); for effectiveness and retention of knowledge which are consulted with the Head of IT Operations (ITO), the Head of IT Development (ITD) and the Project Management Officer (PMO); for the cost and value, which are consulted with the Chief Information Officer (CIO) and the Human Resource Manager (HRM).
- 2)Training Department (TD) evaluates the training content delivery upon completion for relevance and quality, which are consulted with the Head of IT Administrations (ITA) and the Compliance, Audit, Risk and Security (CARS); for effectiveness and retention of knowledge which are consulted with the Head of IT Operations (ITO), the Head of IT Development (ITD) and the Project Management Officer (PMO); for the cost and value, which are consulted with the Chief Information Officer (CIO) and the Human Resource Manager (HRM).
- 3) The TD records the evaluation of the training performance, which is signed by the HRM, and asks the CIO for the approval.
- 4)The TD sends the approved evaluation of training performance records to the ITA and informs the evaluation of training performance to the Business Executive (BE) monthly.
- ► Evaluate the individual performance
 - 1)The HRM evaluates the individual performance regarding with training program, and consults with training participants.
 - 2)The HRM records the evaluation of individual performance to the employee careers path and asks the CIO for the approval.
 - 3)The HRM informs the general individual performance regarding with the ERP system training to the BE monthly.

Fig. 6 Procedure evaluation of education and training of ERP system

5. Conclusions

We have described the methodology and developed the Information Technology (IT) policies for Enterprise Resource Planning (ERP) practices to improve customer orientation and service. The policy was developed based on the specified IT processes related to the achievement of Business Goal 4 (BG4) in COBIT, i.e. *improve customer orientation and service*. Since the proposed IT policies for ERP practices were aligned to the IT goals and the Business Goals, then successful implementation of the ERP could be achieved optimistically.

We have proposed ten IT policies for ERP practices in order to achieve BG4. The IT policies for ERP practices were structured by considering the IT policy objectives, the corresponding Functional Domain (FD) in the ERP system and the Responsible Job Functions. In this paper, the IT policy for ERP practices for IT Process Delivery Support 7 (DS7) i.e. *educate and train users*, is equipped with the management directions as a basis for the development of the procedures. Thereby, the procedures are developed considering the IT policy objectives and the results of the Enterprise Maturity Level (EML). As a result, three related procedures for DS7 have been developed and elaborated in detailed.

Hence, the IT policies could improve the ERP practices in the enterprise. Furthermore, the IT policies for ERP practices ensure the successful achievement of the BG4 during planning, implementation and delivery of the IT services corresponding to the ERP application.
